

PriorityKV: application structure becomes a cache-allocation prior

Original diagram; visual conventions follow token-strip workflows used by H2O, SnapKV, and KIVI

Long agent trace

Role-blind eviction

Agent-critical middle state can disappear

Structure-aware mixed cache

All positions retained; precision follows role

Eviction result [structure >> role-blind at matched keep](#)

INT4 result [no quality gap at 75%; evaluate bytes + latency](#)

The tagger uses prompt metadata, not future attention or benchmark answers.
